

# Dataset Details

The dataset used in this project was created from a video obtained from the free stock video platform Pexels. The selected video contains scenes representing smartphone usage and screen interaction behavior relevant to social media engagement. Since no suitable annotated dataset was available for the specific objective of this project, a custom dataset was developed.

The video was processed using OpenCV to extract individual frames. Approximately 700 frames were generated and manually annotated using the YOLO annotation format. Each frame was labeled with bounding boxes to identify objects associated with social media usage behavior. The annotated images were then divided into training, validation, and testing datasets for model training and evaluation.

## Dataset Information:

- Source: Pexels Video Platform
- Dataset Type: Custom Video-Based Object Detection Dataset
- Number of Frames: Approximately 700
- Annotation Format: YOLO
- Data Split: Train, Validation, and Test Sets
- Image Format: JPG
- Label Format: TXT (YOLO Format)

## Dataset Preparation Steps:

1. Downloaded a relevant smartphone usage video from Pexels.
2. Extracted video frames using OpenCV.
3. Manually annotated the extracted frames.
4. Converted annotations into YOLO format.
5. Organized data into training, validation, and testing folders.
6. Used the prepared dataset for YOLO model training and performance evaluation.

The custom dataset enables the detection of social media-related interactions from video frames and provides the foundation for developing an AI-based Social Media Addiction Detection system.
