

HUGGING FACE:

Sentiment Analyzer

Problem Statement

People share opinions and feedback on social media, reviews, surveys, and online platforms every day. Analyzing these opinions manually is time-consuming and difficult when dealing with large amounts of text.

The Sentiment Analyzer aims to automatically identify the emotional tone of a text input and classify it as Positive or Negative using Natural Language Processing (NLP) techniques. This helps users quickly understand the sentiment expressed in reviews, comments, and feedback without manual analysis.

Objective

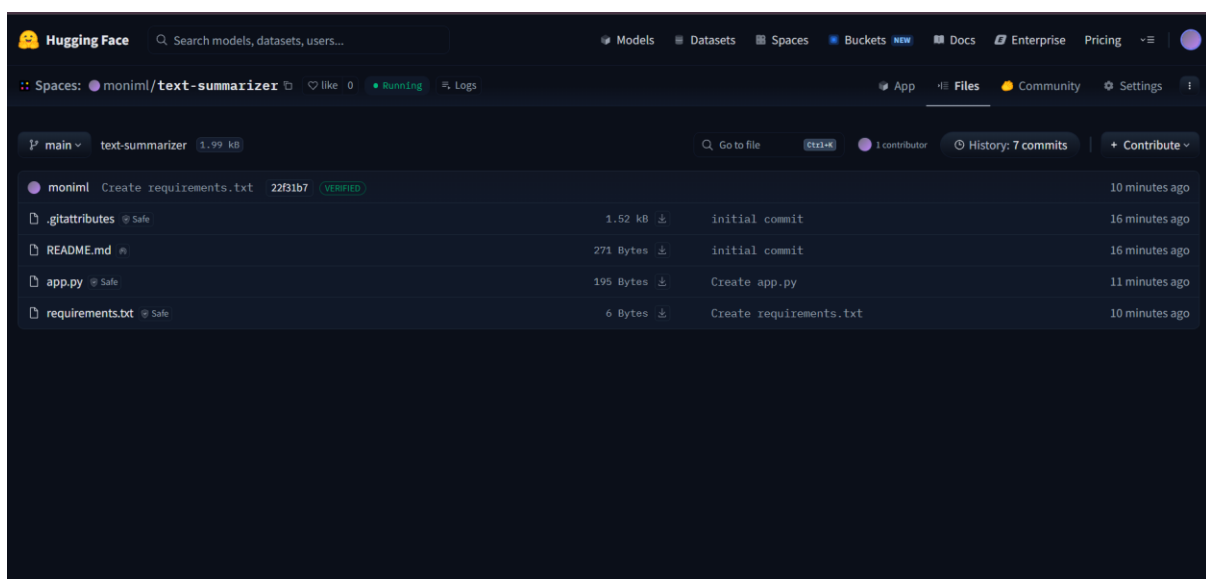

To develop an AI-powered web application that accepts text input from users and predicts the **sentiment of the text using a pre-trained machine learning model.**

Expected Outcome

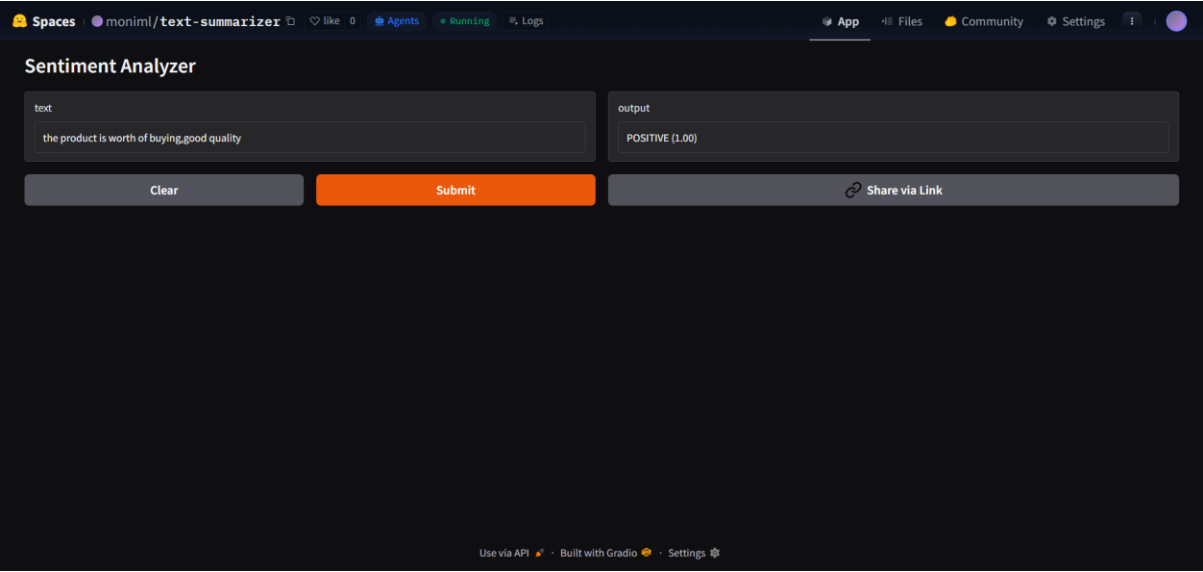

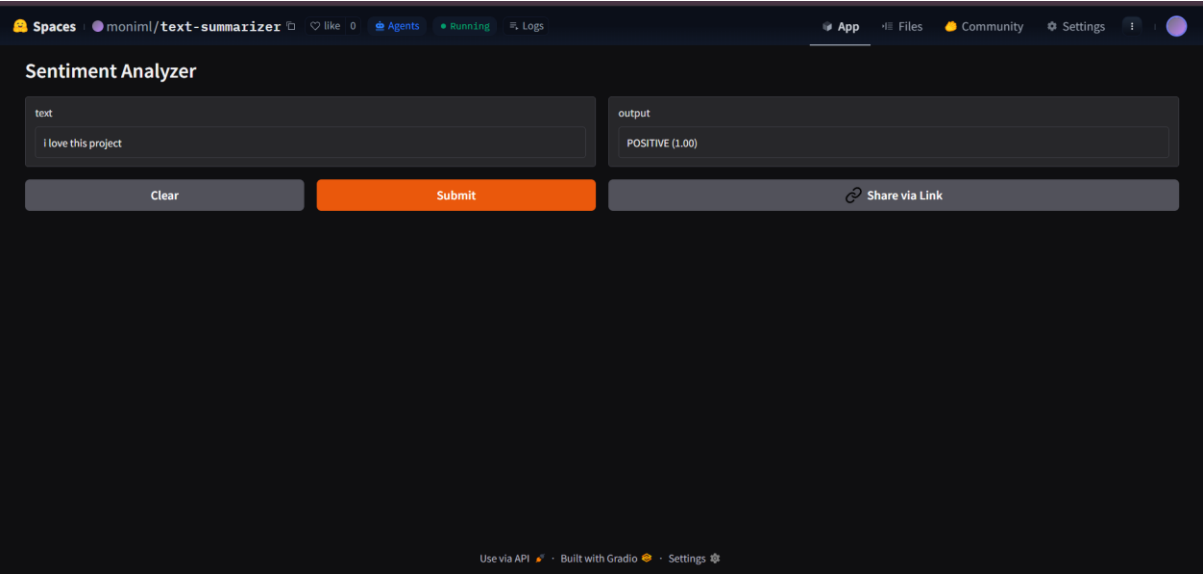

- Accept user text input.
- Analyze the sentiment of the text.
- Display the predicted sentiment (Positive or Negative).
- Provide a confidence score for the prediction.
